

Start Strong with Agro-Start

Agro-Start is a liquid starter fertilizer with a high phosphorus content (30%) in the form of orthophosphates and polyphosphates. This liquid nutrient also contains nitrogen (10%) and potassium (3%) in ratios specifically designed to enhance and facilitate the plant's use of phosphorus.

Agro-Start is enriched with zinc and boron. Boron, in association with calcium, is essential for cell division and the synthesis of cell walls. Zinc is crucial for cell proliferation and is necessary for the production of enzymes that regulate cell division. Agro-Start also includes indole-3-butyric acid (IBA), a growth hormone that promotes the production and growth of plant rootlets.

This advanced combination improves and enhances the absorption, transport, and accumulation of essential minerals within the plant.

Whether used in planting water, transplanting water, or in tray soaking water, Agro-Start maximizes the supply and translocation of phosphorus needed for optimal root development in young seedlings.

By stimulating the production of natural root growth factors, Agro-Start's compounds make it an exceptional starter fertilizer.

From its earliest stages, a plant with robust root development is set to achieve superior yields and high-quality harvests
